And The invention relates to an isolated peptide of a novel human nuclear hormone receptor with a fully defined sequence of 457 amino acids given in the specification. The novel human nuclear hormone receptor peptides and nucleic acids encoding them can be used as models for the development of human therapeutic of human therapeutic targets, aid in the identification of therapeutic of human therapeutic agents that modulate nuclear hormone receptor activity in cells and tissues that express the nuclear hormone receptor activity in cells and tissues that express the nuclear hormone receptor. The nucleic acids may be used as a query sequence to perform searches against sequence of the used as a query sequence to perform searches against sequence of primers, to construct recombinant vectors, to identify compounds that confidentify family members or related sequences, as probes or primers, to construct recombinant vectors, to identify compounds that confidentify and as antisense constructs to control nuclear hormone receptor consector raise antibodies or to elicit an immune response, as a reagent in assays designed to determine protein levels in biological fluids, as markers for tissues in which a corresponding protein is expressed, to identify a binding partner/ligand to develop a system for the dentify compounds that modulate protein assays, and to identify compounds that modulate protein activity. This contains a seasons as a season be assays, and to identify compounds that modulate protein the human nuclear contains assays.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ó

The sequence given shows a fusion between retinoic acid receptor (RAR) alpha and myl which is characteristic of acute promyelocytic leukemia (APL). This is caused by a translocation of a portion of the long arm of chromosome 17 onto the long arm of chromosome 15 [t(15;17)(q21;q11-22)]. The breakpoint region has been cloned and has been shown that DNA rearrangements are clustered in the region of the first intron of RAR-alpha. This sequence was isolated by polymerase chain reaction (PCR) using primers which correspond to sequences both 5′ and 3′ to the breakpoint region.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               2568 GCAGTACTGGGGACCTTCCCTGGGGGACGGGGAGGAGGAGGAGCAGCACCTCCTTGAAGA

This sequence encodes a human myl/RAR-alpha (retinoic acid receptor alpha) fusion protein which is used in a method for identifying a subject with acute promyelocytic leukaemia (APL) resulting from a t(15;17) translocation who will respond to treatment with all-trans retinoic acid. The protein can also be used to identify a subject with indications of APL who will not respond to treatment with all-trans

                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes a composition which comprises two antisense oligonucleotides. The first oligonucleotide is specific for a cytoplasmic oncogene or proto-oncogene selected from ras, raf, EGF-1, c-fms, c-ros, c-kit, c-met, c-trk, c-src, c-abl, bcr-abl, c-fgr and c-yes. The second oligonucleotide is specific for a nuclear oncogene or proto-oncogene selected from myc, jun, c-ets, c-fos, c-myb, B-myb, c-rel, c-vav, c-ski, c-spi, cyclin Dl, PML/RAR alpha, AMLL/MTG8, c-rel, c-vav, c-ski, c-spi, cyclin Dl, p-mucleotides and such and all-l/AR-1. AR-1 and ALL-l/AR-1 for composition is used for treating cancer. The composition of antisense oligonucleotides has synergistically enhanced ability to inhibit growth of cancer cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence represents an oncogene from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          2447

Thoomic teoprotein RMSA P, which is involved in the processing of trans. Thomic teoprotein RMSA P, which is complementary to the target RNA sequence. The sequence which is complementary to the target RNA sequence. The creognition arm which is complementary to the target RNA sequence. The creognition arm which is corpus acceptor stem and the D stem of trans. The A recognition arm is located at the 3' end of the EGS and the D at the 5' correspond to the aminoacyl sequence forms a structure corresponding to the T stem and T loop of precursor tRNA. The modified EGSs of the chargeting sequence transponding to the T stem and T loop of precursor tRNA. The modified EGSs of the coording the A and D arms, and the T stem and loop can consist of the molatied. The A and D arms, and the T stem and loop can consist of ribonucleotides with 5' phosphorothioate linkages;

C' "modified Thomic Leotides With 5' phosphorothioate linkages;

                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to modified human RNAse P external guide sequences (BGSs). The BGS is a ribozyme which forms the catalytic domain of the ribonucleoprotein RNAse P, which is involved in the processing of tRNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            2922

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            3342
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     3402
                                                                                      PML-RAR-alpha DNA (AAT33259) is associated with acute promyelocytic leukaemia (APL). APL is characterised by a balanced, reciprocal translocation between the long arms of chromosomes 15 and 17, resulting in a fusion of the retinoic acid receptor gene (RAR-alpha) and a gene for a putative transcription factor, PML. Methods for treating APL involve the use of ribozymes, external guide sequences and antisense oligonucleotides (see also AAT33245 and AAT33245) the specifically cleave the PML-RAR-alpha fusion mRNA (see also AAT33251) but not wild-type RAR-alpha mRNA. Plasmids carrying portions of the PML-RAR-alpha and RAR-alpha genes (see also AAT33260) allow synthesis of shortened versions of APL mRNA in vitro, facilitating testing and screening processes.
                                                                                                                                                                                                                                                                                                                                                          316
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 556

NCI_CGAP_Carl is a cDNA library containing the following tissue(s): Osteoarthritic Cartilage The library was constructed according to Bonaldo, Lennon and Soares, Genome Research, 6:791-806, 1996. First strand cDNA synthesis was primed with an oilgo-dry primer containing a Not I site. Double stranded cDNA was ligated to an EcoR I into pT713-Pac vector. The oilgonucleotide used to prime the synthesis of first-strand cDNA contains a library tag sequence that is located between the Not I site and the mannancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               TACTGGGGACCTTCCCTGGGGGACGGGGGGGGGGGGCGACTCCTTGGACAGGC 380

/cloned with a NotI-oligo(dT) primer. Five prime end enriched, double-stranded cDNA was digested with Not I and cloned into the Not I and Eco RV sites of the pCMVSPORT 6 vector. Library was normalized. Library was constructed by Life Technologies.
